**Geologic History of the Bedrock Surface**

Indianapolis is the largest city in the United States and the state's capital. It is known for its skyline, which includes the iconic John Hancock Center. The city is a major financial center and has a thriving arts and culture scene. Nearby, the city of Bloomington is home to Indiana University, a major research institution with a strong focus on the arts and sciences. The natural landscape includes the Hoosier National Forest, which offers opportunities for hiking, camping, and wildlife viewing.

---

**Mapping Methods**

This map is a tool for delineating bedrock valleys where soil and ground deposits commonly cover the exposed bedrock. The map includes many landforms and working hypotheses that influence the probability of finding economically viable bedrock.

---

**Data Distribution**

The data shown on this map is not complete and is not current. The bedrock topography shown on this map is not to scale or to the degree of detail shown on the geological map. This map can be used as a guide for determining the probable location of bedrock outcrops and the relative position of bedrock beneath the surface soil. The map is intended to be used as a general reference tool to assist in the identification of potential sites for further exploration.
